EVIDENCE-FIRST CAREER FOCUS

Rolecraft.

Decide where to focus. Not just how your CV reads.

Grounded in your own words | Fits your weekly hours | Offline by default | Multi-agent mode

React, TypeScript and Next.js. Runs on your own machine.

A better-worded CV doesn’t answer the harder question

WHAT A CV OPTIMISER ANSWERS

How should this CV read for a job I have already chosen?

WHAT A PERSON HAS TO DECIDE FIRST

Which role should I aim for, what is missing, and what do I do with my next few weeks?

Rolecraft starts with that decision, then builds the plan, the CV and the outreach from the answer.

The odds for each application are long

GRADUATE VACANCY

~140

applications received for each vacancy

ISE Student Recruitment Survey 2025, UK employers

INTERNSHIP

~100

applications received for each internship

ISE 2024–25: 101 (UK). Handshake 2024–25: 109 (US)

ESTIMATE

1 in ~140

chance that a given graduate application succeeds

Derived from the ISE figure, assuming about one hire per vacancy

Where you aim changes the odds: 69 applications per hire in legal, 290 in retail, FMCG and tourism (ISE 2025).

No reliable per-student figure exists. One survey of early-career researchers found at least 15 applications per offer.

Competition is rising, and guidance is thin

43 to 109

average applications per internship posting, 2022–23 to 2024–25

Handshake Internships Index 2025 (US)

+27%

internship applications in the latest survey, while internship places fell about 8%

ISE Student Recruitment Survey, 2025–26 cycle (UK)

38%

of UK university students were uncertain about their plans. 45% felt unprepared to get a job

Prospects (UK)

38%

of US graduates got timely career information, against 53% who got career guidance

Strada survey, via Inside Higher Ed 2024

More applications is not the answer. Knowing where your evidence is strong is.

Rolecraft is built for that decision: where to aim, what to do with your hours, and what to say.

One flow, from CV to next action

1

Your experience

CV, projects, interests, weekly hours, apply-by date

2

Directions

A best fit, an adjacent field and a stretch

3

Plan

Tasks sized to your hours

4

Tailored CV

Your wording, no new facts

5

Next step

This week's task and one email

One example user: a product analyst with 4 hours a week and 6 weeks to go.

The next five slides show the real screens for this example CV.

Three directions, each backed by your own words

Quoted evidence

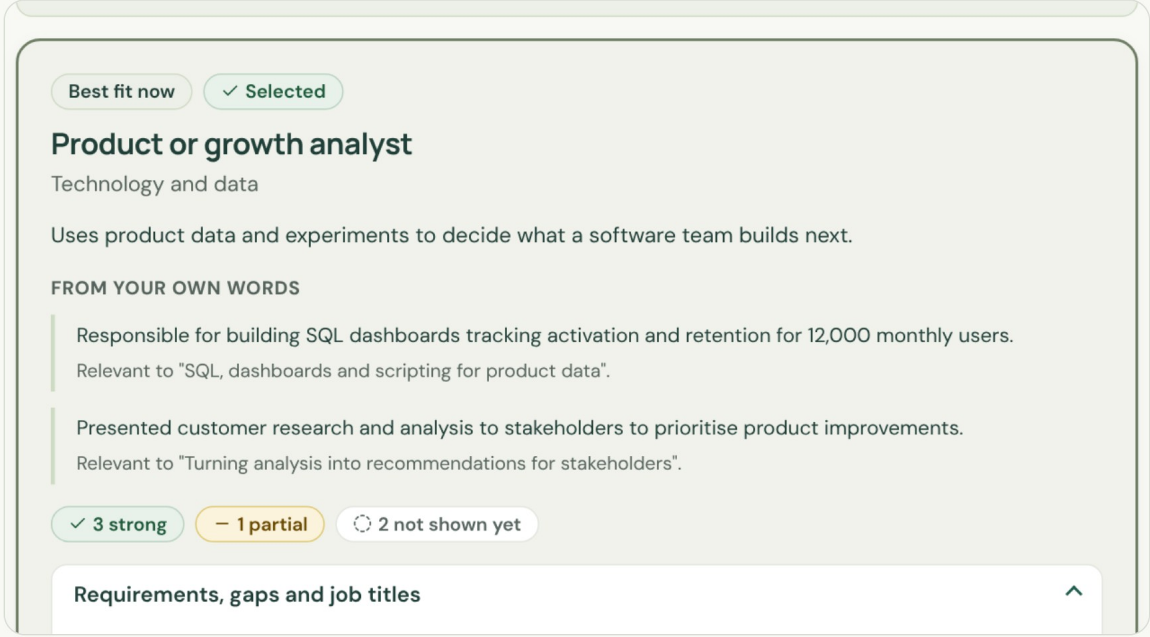

Each reason is a line copied from the CV, not a paraphrase.

Strength in words

Strong, partial or not shown yet. No match percentages.

Three tiers

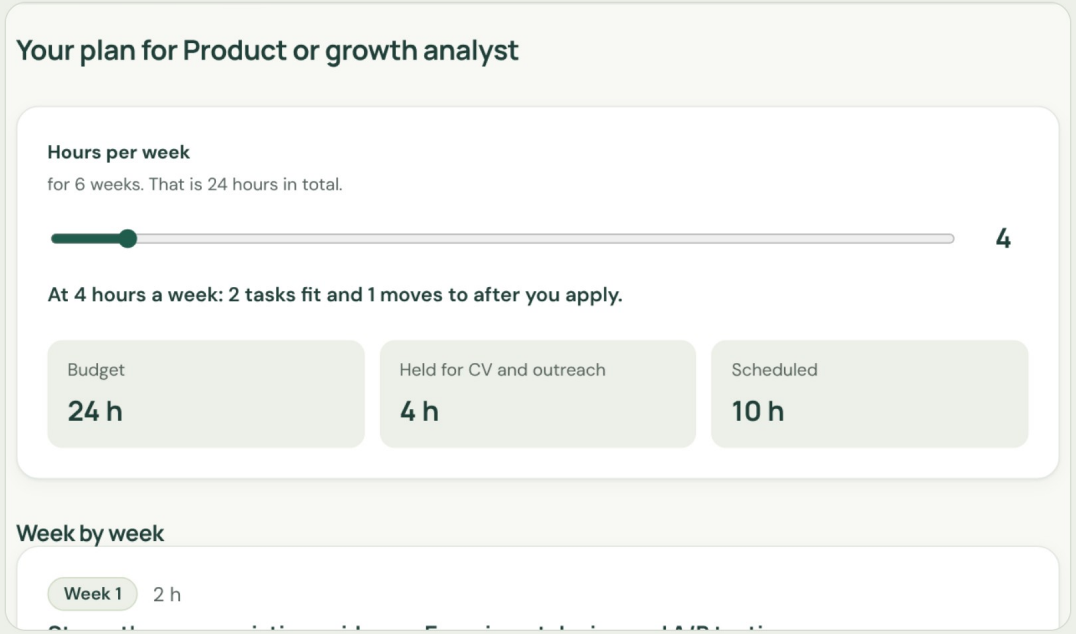

A best fit, an adjacent field and a stretch, with the gaps stated.

Real output for the example CV. The badges name the evidence in words.

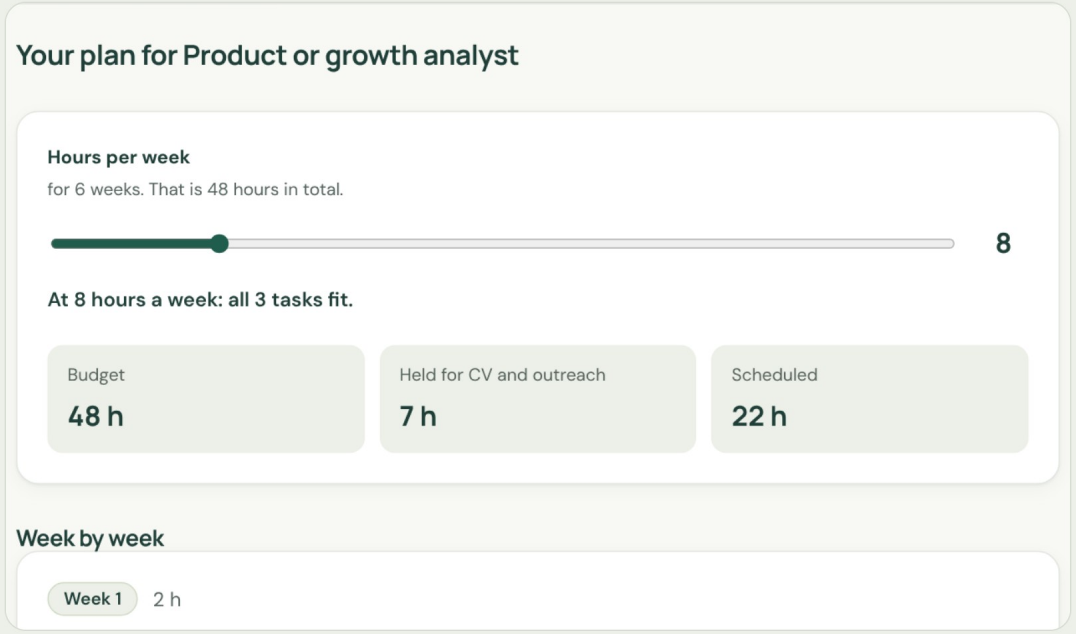

A plan sized to your hours

At 4 hours a week

One task moves to “After you apply”.

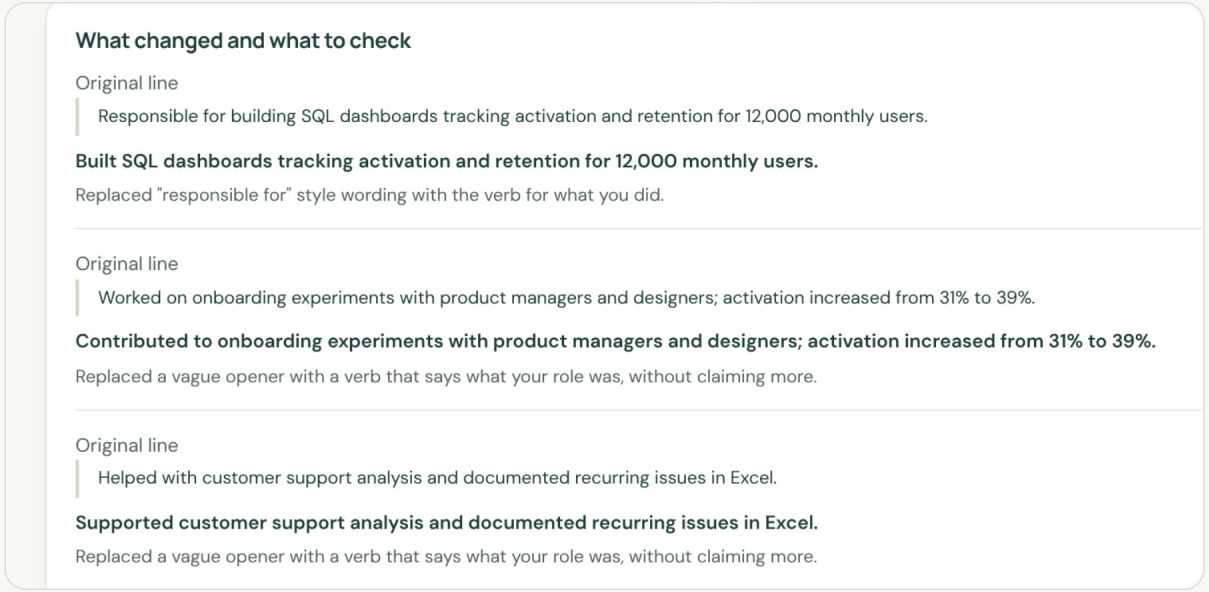

At 8 hours a week

All three tasks fit.

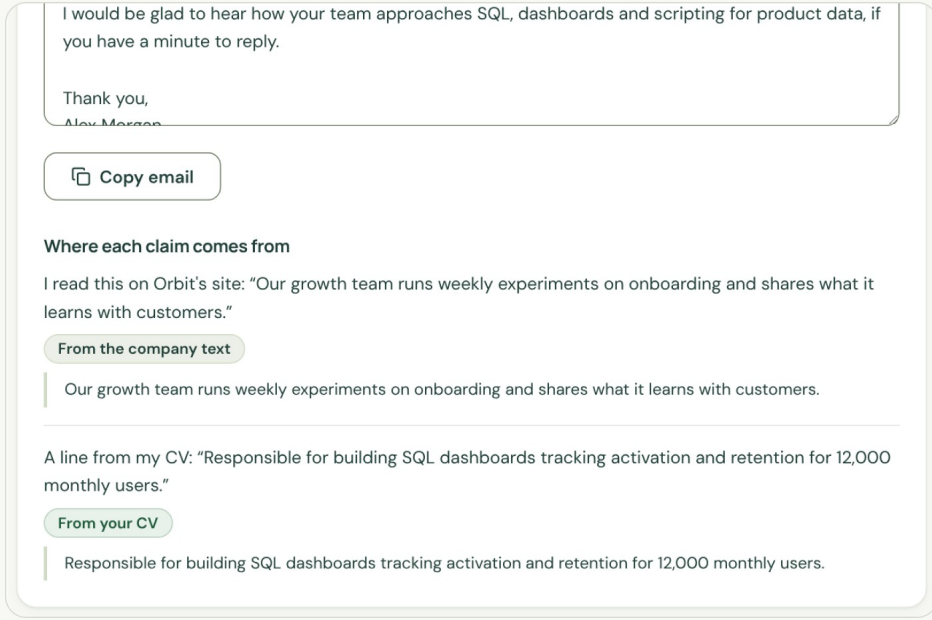

Your words, tightened. No new facts.

Tailored CV

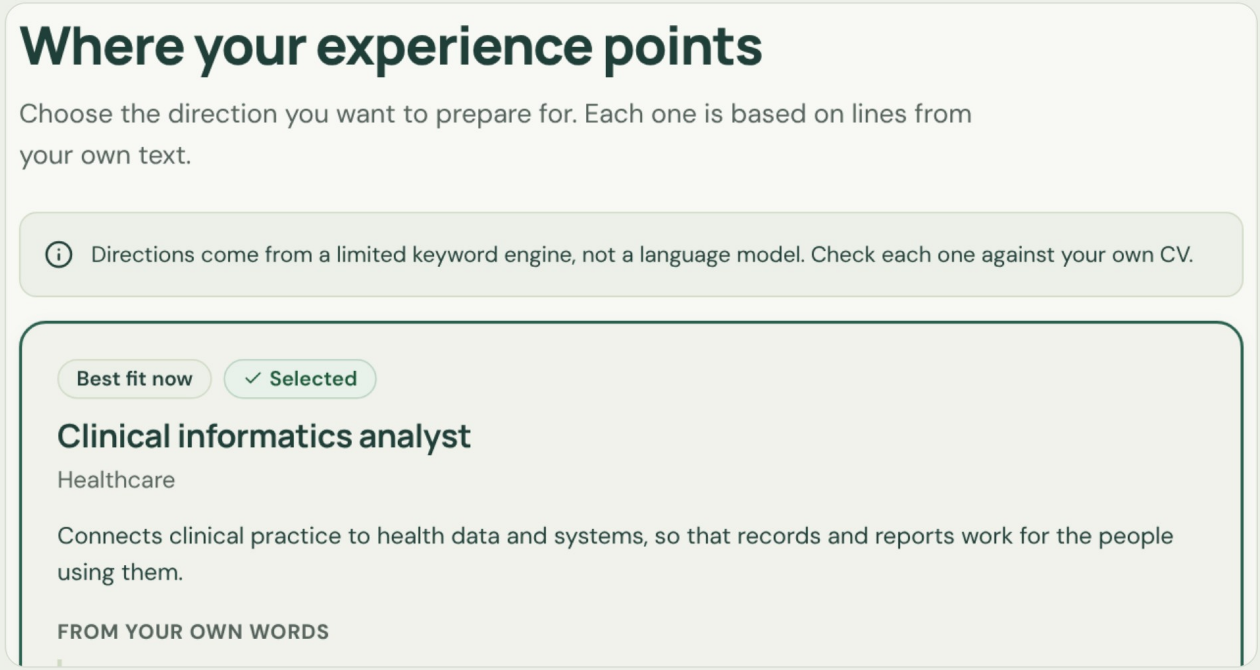

Each rewrite shows the original, the change and the reason.

Outreach email

Each claim names its source: the CV or the company text.

Works across fields, not only tech

A nurse's example CV lands on clinical informatics. Real output.

34
role families across 12 fields

136
skill terms, each with synonyms

10
example CVs from different fields, each tested for a sensible first direction

One orchestrator, five specialist agents

The orchestrator is ordinary code. It sets the order and runs the planner and the tailor at the same time.

AGENT 1

Evidence reader

Finds the lines that show what you have actually done.

AGENT 2

Direction mapper

Maps that evidence to 34 curated role families and names the gaps.

Run in parallel

Gap planner

Turns gaps into tasks sized to your hours.

CV tailor

Tightens your wording and adds no facts.

AGENT 5

Outreach writer

Drafts one email from a CV line and a line of company text.

Grounding layer, in code: every quote must appear in your CV, and a claim that fails is removed.

Status: built and tested against a stand-in for the API. This demo runs the offline engine.

Agents propose. Code verifies.

Real output of the grounding check. The original CV line is “Led a team of designers on checkout”.

Result	Rewrite proposed	What the check found
REJECTED	Led a team of five designers on checkout	adds numbers not in the original line: 5
REJECTED	Led a team of designers on checkout and doubled conversion	adds numbers not in the original line: doubled
REJECTED	Led ex-Google designers on checkout	introduces words that are not in the original line: ex-google
REJECTED	Led a team of designers on checkout using kubernetes and python	introduces words that are not in the original line: using, kubernetes, python
ACCEPTED	Led designers on checkout	no problem found

One retry, with the reasons

If nothing verifiable is left, the step fails instead of guessing.

A trace of every run

Each agent, its model, and what it kept or removed.

The same rules offline

Offline rewrites pass this same check.

Built to be trusted and used

Private by default

The offline engine runs in the browser. Live mode shows exactly what will be sent and waits for consent.

Usable by everyone

An accessibility audit found no violations on any step, at desktop and phone width. Keyboard and focus handling are built in.

816 test checks

Five suites, including a property test that tailoring adds no word or number that is not in the CV.

A guarded server

The job-posting fetch refuses private and reserved addresses. API routes cap request size and rate.

THE DIFFERENCE

Decide where to spend your hours.

Every claim traced to your own words.

Rolecraft. Runs offline today. Multi-agent mode built, tested against a stand-in API, next to run live.
